User-Centered Design

SWE 632
Spring 2018

© Thomas LaToza

Looking ahead

- Examined human cognition
- Have 2 ways to identify usability issues
- But... is HCI just identifying usability issues?
- What does **design** mean?
- How do we learn about user **needs**?
- How do we build designs?
- How do we evaluate designs?

User-centered design

User-centered design

Who are the users?

How does the product fit into the broader context of their lives?

What are the user's needs?

What problems may users encounter w/ current ways of doing things?

What are the user's tasks and goals?

What extreme cases may exist?

Technology-centered design

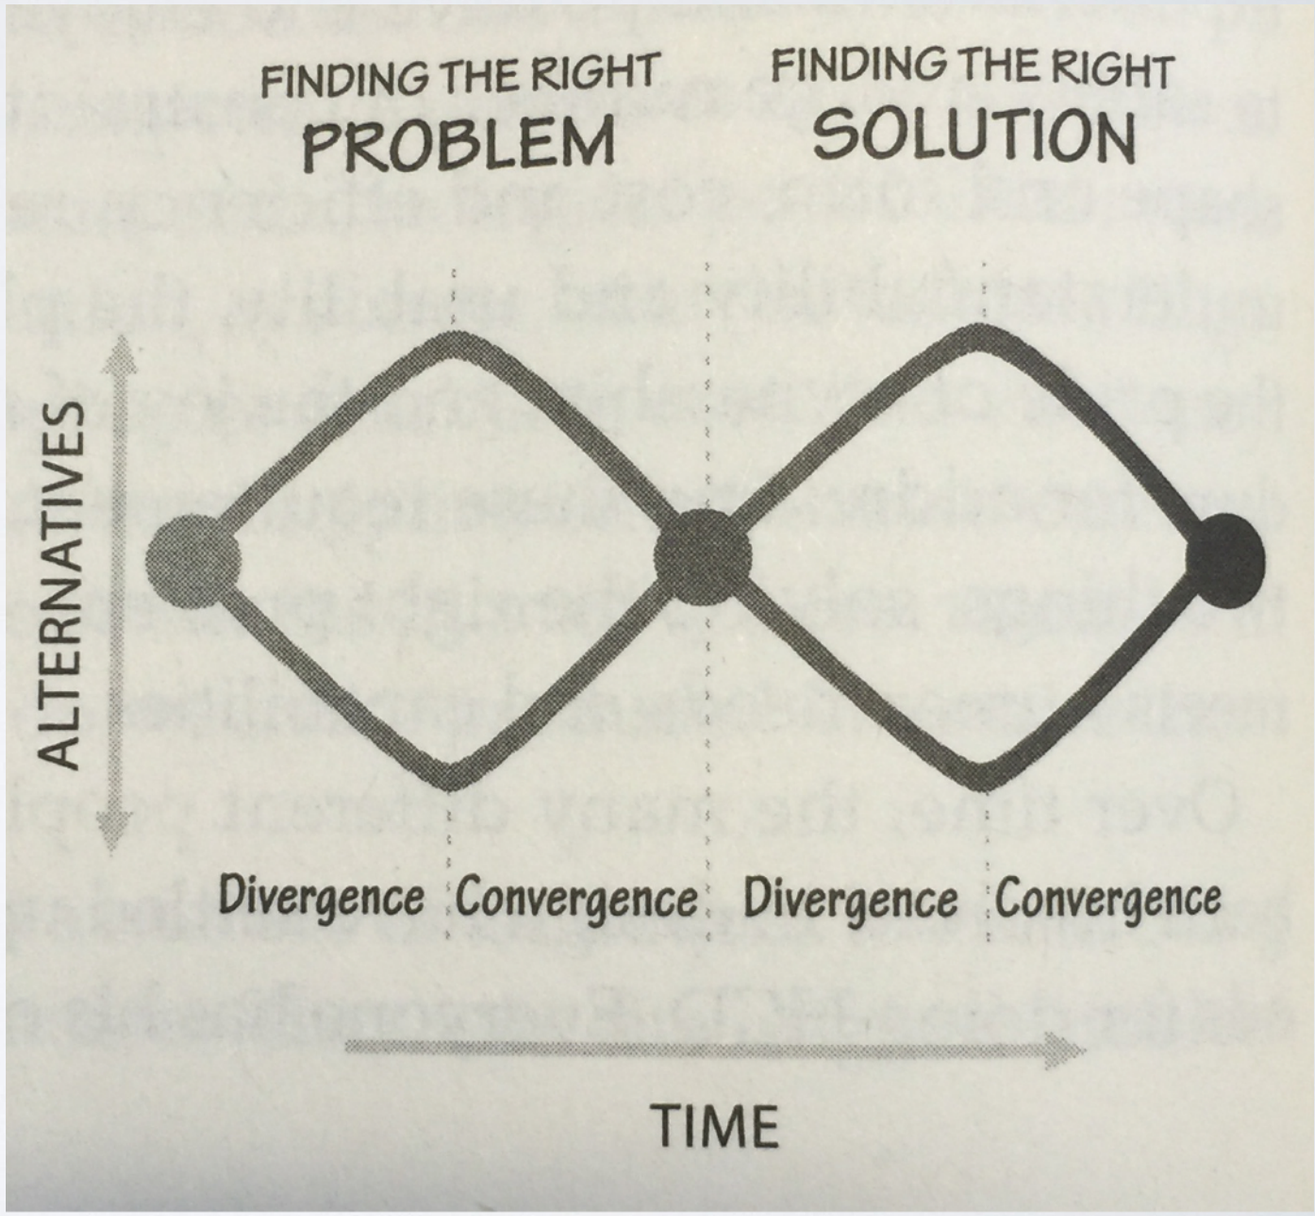
What can this technology do?

How might users use it?

What features does it have?

Double diamond model of design

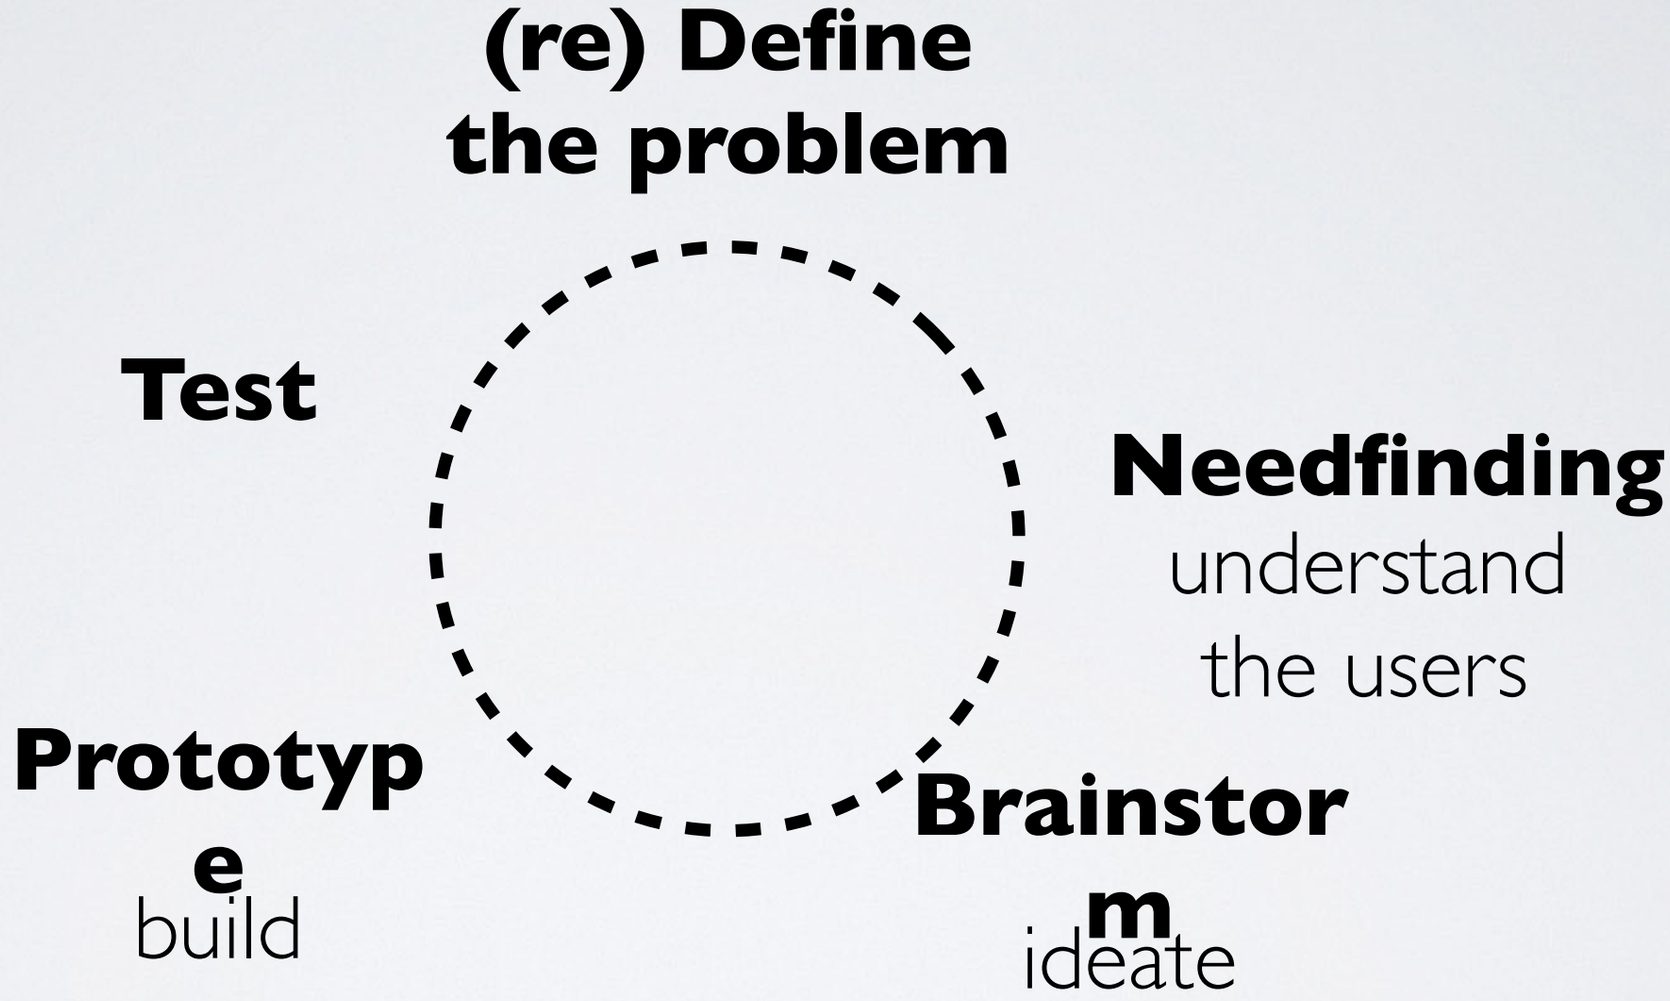
- Question problem, expand scope, discover fundamental issues
- Converge on problem
- Expand possible solutions
- Converge on solution



Fail fast

- "Fail frequently, fail fast" David Kelley, founder of Ideo
- Failure is **learning** experience
- Crucial to understand correct **problem** to solve & ensure solution is appropriate
- Abstract requirements are invariably wrong
- Requirements produced by asking people what they want are wrong

Iterative model of design



Iteration

- Repeated study and testing
- Use tests to determine what is working or not working
- Determine what the problem might be, redefining the problem
- Collect more data
- Generate new alternatives

The Usability Life Cycle

Any project, even a small project, benefits from incorporating usability early on. During the Analysis phase, set goals and determine who will use the product for what purpose. The Design phase is iterative. That is, the design team continuously evaluates whether the design works for users. Ongoing emphasis on usability throughout the Implementation and Deployment phases helps maintain a user-centered focus during last-minute changes and when planning for the next version. As you plan the project, determine what usability steps will best meet your user and business needs– the darker the square, the more important the step.

START

ANALYSIS Phase

meet with key stakeholders to set vision

Multidisciplinary team

The design team should include expertise in usability, human factors, marketing, graphic design, technology, engineering, quality assurance, and performance support. Collaborating with each discipline during the analysis, design, and implementation phases will ensure the design meets usability needs; accomodates the technology being used; portrays the interface in a way that will not jeopardize branding; and reflects the intended functionality.

include usability tasks in the Project plan

assemble a multidisciplinary team to ensure complete expertise!

develop usability goals and objectives

conduct field studies

look at competitive Products

congratulations! thorough groundwork increases your chance of success!

remember: validate early and often with users!

Field studies

are an excellent way to obtain information about the users' environments and how they do real work in those environments. Field studies can include both interviewing users and observing their behavior. However, these studies are always conducted in the users' workplaces. Data from field studies drives development of user profiles, task analysis, scenarios, and usability testing protocol.

"content experts" not really end users - oops!

create user Profiles

develop a task analysis

document user scenarios

congratulations! you now have the info needed to make informed design decisions

User profiles

document the various categories of users and their characteristics. They help a team get a handle on who will be using the system in what ways. User profiles can include information such as demographics, technology experience, subject matter expertise, attitudes and motivations, and frequency of use. Creating posters for different user profiles is a fun and compelling way to make users real for the design team.

Task analysis

helps the team understand what can be done with the system. It can include task frequency, importance, and which user groups will do the task. Task analysis can also incorporate a workflow diagram, which is a good way to show the process behind how users does their work.

create low-fidelity prototypes

begin design with paper and pencil

detailed design implemented too soon - oops!

remember: every step in the process contributes to UCD! *

Conceptual model

Users form "mental models" about how a system works. A well-designed system portrays a strong conceptual model that helps users form an accurate mental model and matches the way users think about their work. The conceptual model is the over-arching "theme" of the design. Scenarios, metaphors, and the navigation model all contribute to a high-level design that demonstrates the conceptual model.

Walkthrough

In a walkthrough, the design team and users meet to step through a design concept and evaluate how well it works with actual tasks. Various walk-through techniques can be used to evaluate early concepts and designs.

User Scenarios

are stories about how real people do their work. They often contain specific people's names and data about how a task is done. Scenarios aid the design team in focusing on real-world people and tasks and can be used in a walkthrough to evaluate design options.

Navigation model

The navigation model is the big picture, or "bird's eye view" of the system. It considers where users start, how they get from here to there, and what all of the major elements will be (such as screens.) A flow diagram of the system elements can represent a navigation model.

DESIGN Phase

document user performance requirements

begin to brainstorm design concepts and metaphors

create navigation and navigation model

walkthroughs of design concepts

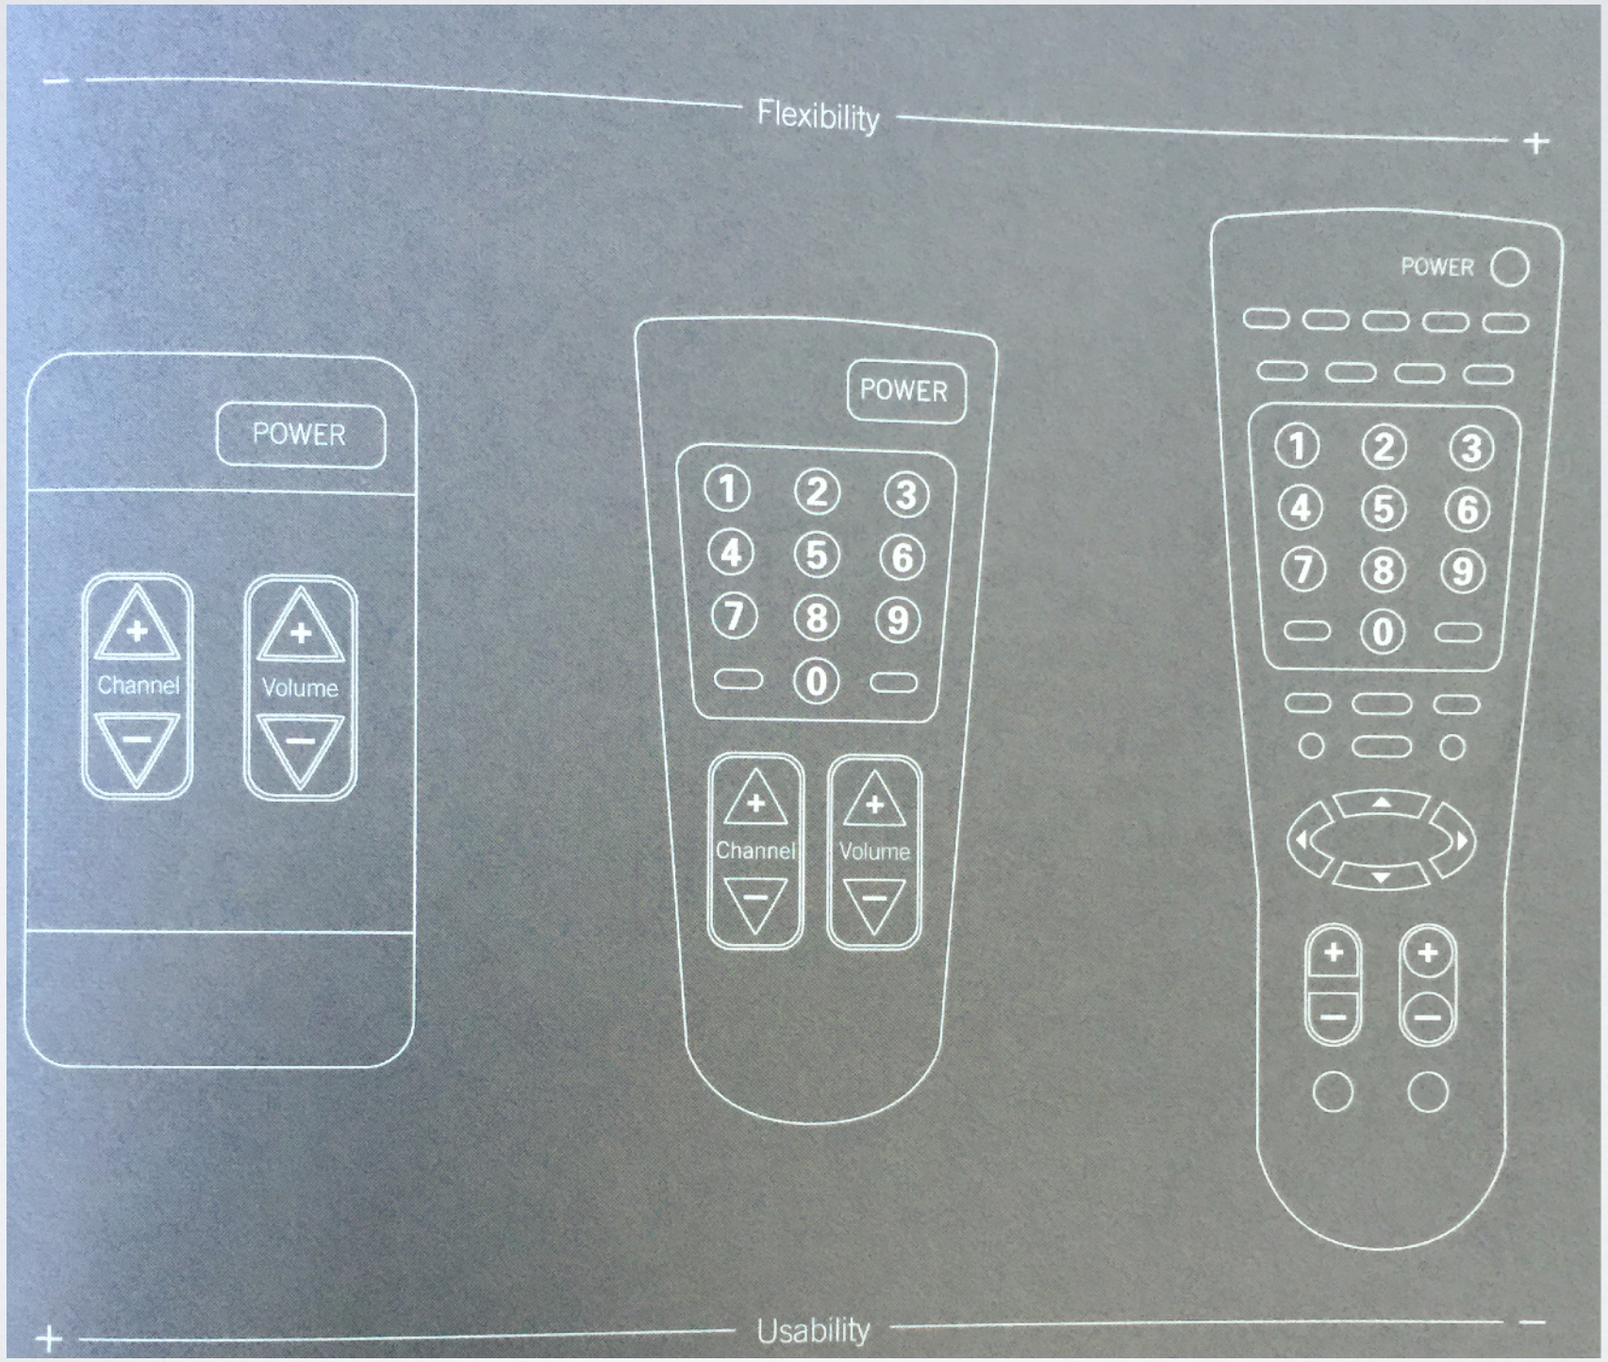
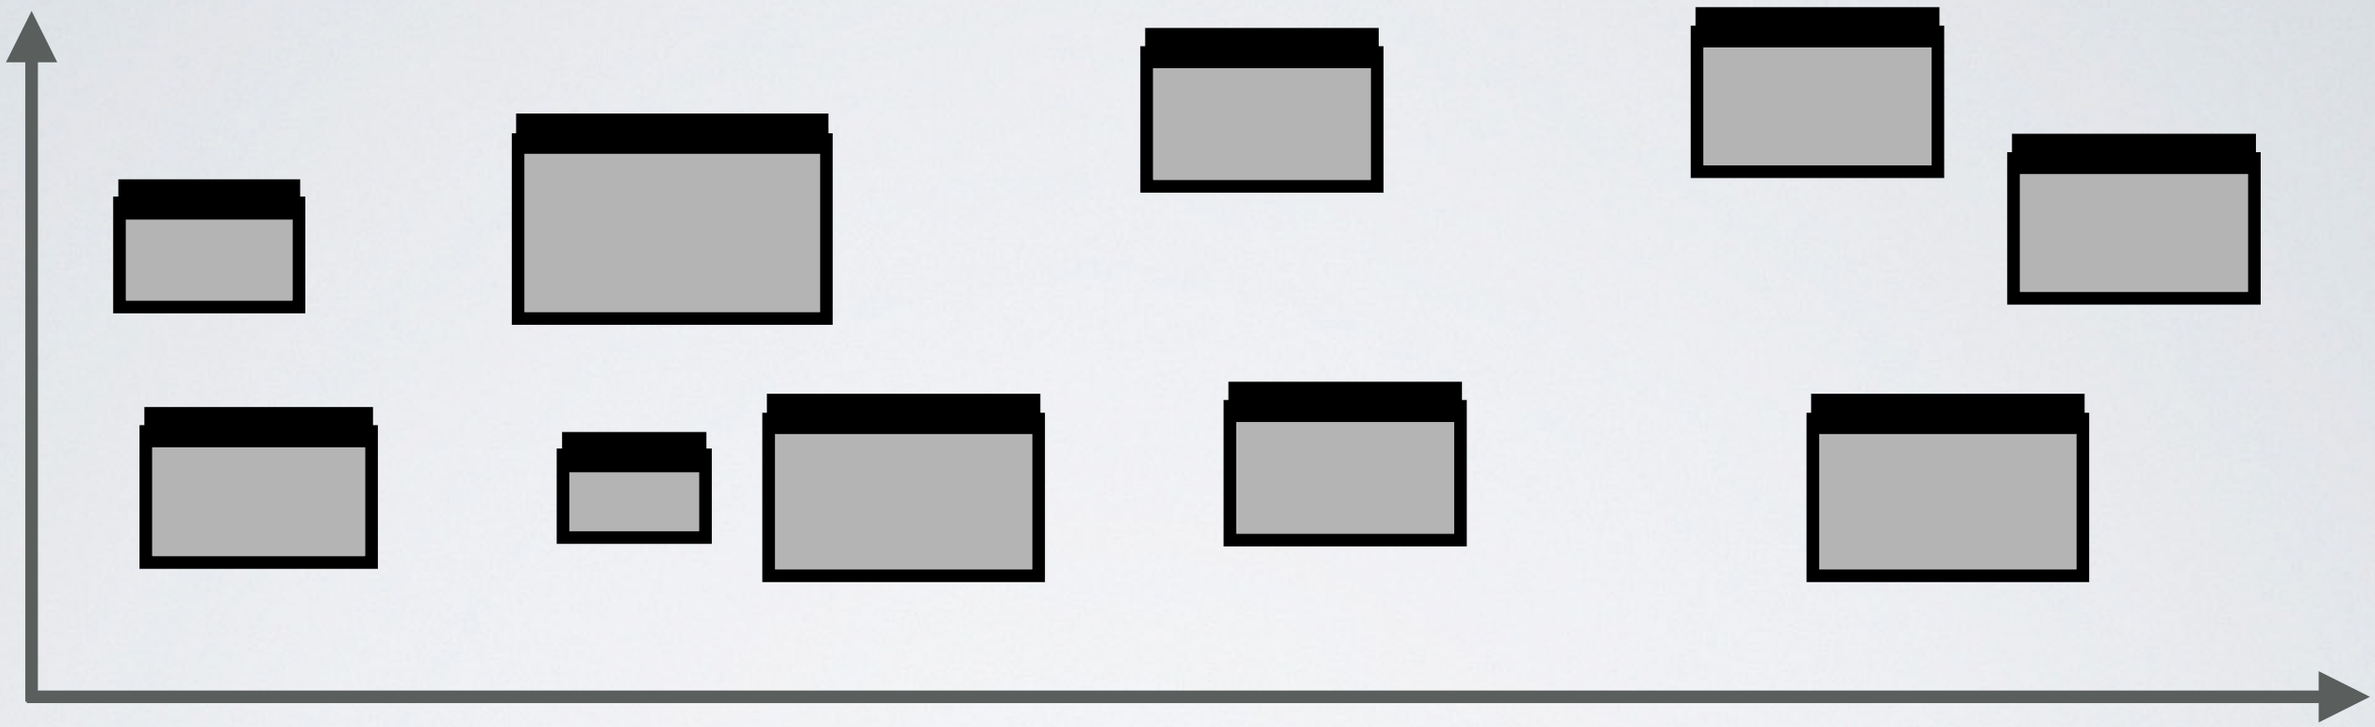
Flexibility-usability tradeoff



Flexibility-usability tradeoff

- Jack of all trades, master of none
- Better understanding needs enables specialization and **optimization** for common cases
- System evolution over time:
  - flexibility —> specialization

Navigating a design space



- What are key decisions in interaction design
- What alternatives are possible
- What are tradeoffs between these alternatives

Hierarchy of design decisions

- What are you (**re**)designing?
  - the width of the text input
  - the maximum length of a valid username
  - when in the signup process users enter their username
  - if the user must create a username when signing up
  - whether users are anonymous or have a login
  - if users can interact with other users in your application

Picking the right level of redesign

- Where are the user's pain points
- What are the underlying causes
- What would be the value to the user of addressing issue
- What do you have time to build (or change)

Activities and tasks

- **Activity** - set of tasks performed together for a common goal
  - Go shopping
- **Task** - component of an activity, organized cohesive set of operations towards a single low-level goal
  - Drive to market
  - Find shopping basket
  - Find item in store
  - Pay for items

Activities and tasks

- Activities are **hierarchical**
- High-level activities spawn other activities, spawn tasks
- Software supports tasks and activities
- Important to design for **activities**, not just tasks
  - Support whole activity seamlessly
  - Ensure interactions between tasks do not interfere

Example - iPod

- Supports entire activity of listening to music
  - discovering music
  - purchasing music
  - getting it into music player
  - developing playlists
  - sharing playlists
  - listening to music
  - ecosystem of external speakers and accessories

Example of a design process

- How do you get from let's make listening to music better to designing an iPod??
- Iterative design...
- But what does that actually look like more concretely?
- What insights into activity help inspire design?
- How does watching users help lead to these insights?
- How do insights translate into an actual real design?
- How do know the new design is actually better?

Example

Domain: Debugging

- Design goal: how do we better support activity of debugging in large, complex codebases?

- Build a better debugging tool (?)

- What should it do? How would it help?

    - Design a better watch window?? Support new types of breakpoints?

- What's really the key steps in debugging that lead users to struggle the most?

Observations of developers in the field

Participants

17 professional developers

Tasks

~90 minutes
picked one of **their** own coding tasks involving unfamiliar code

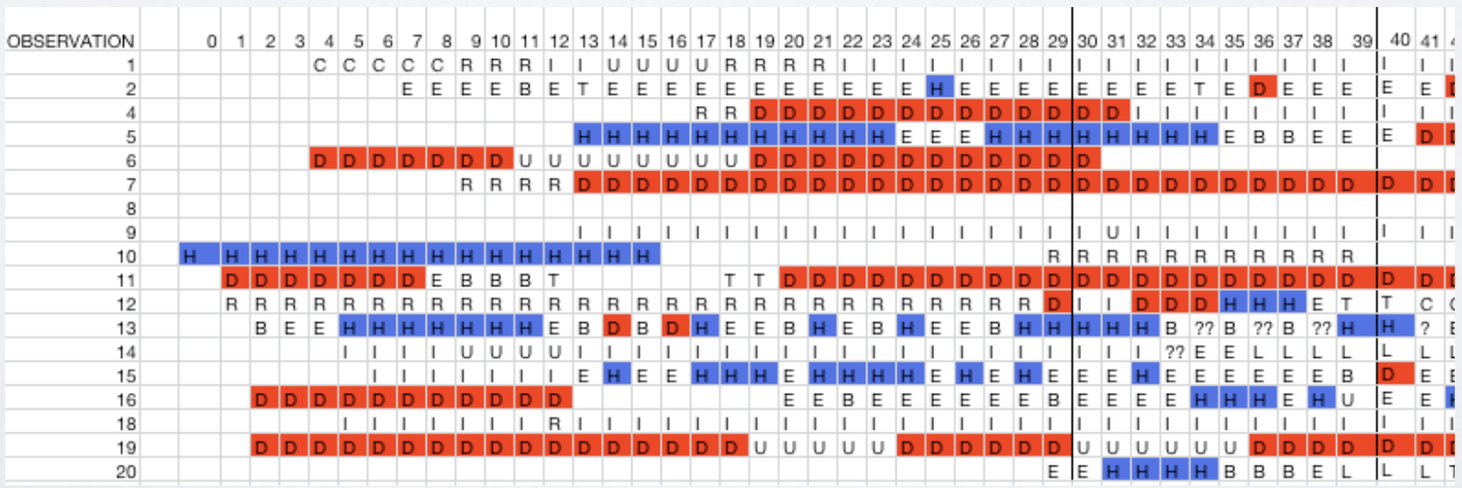
Transcripts

> Interesting. This looks like, this looks like the code is approximately the same but it's refactored. But the other code is.
>
> Changed what flags it's ???
>
> He added a new flag that I don't care about. He just renamed a couple things.
>
> Well.
>
> So the change seemed to have changed some of the way these things are registered,
>
> but I didn't see anything that talked at all about whether the app is running or whether the app is booted.
> So it seems like, this was useless to me.

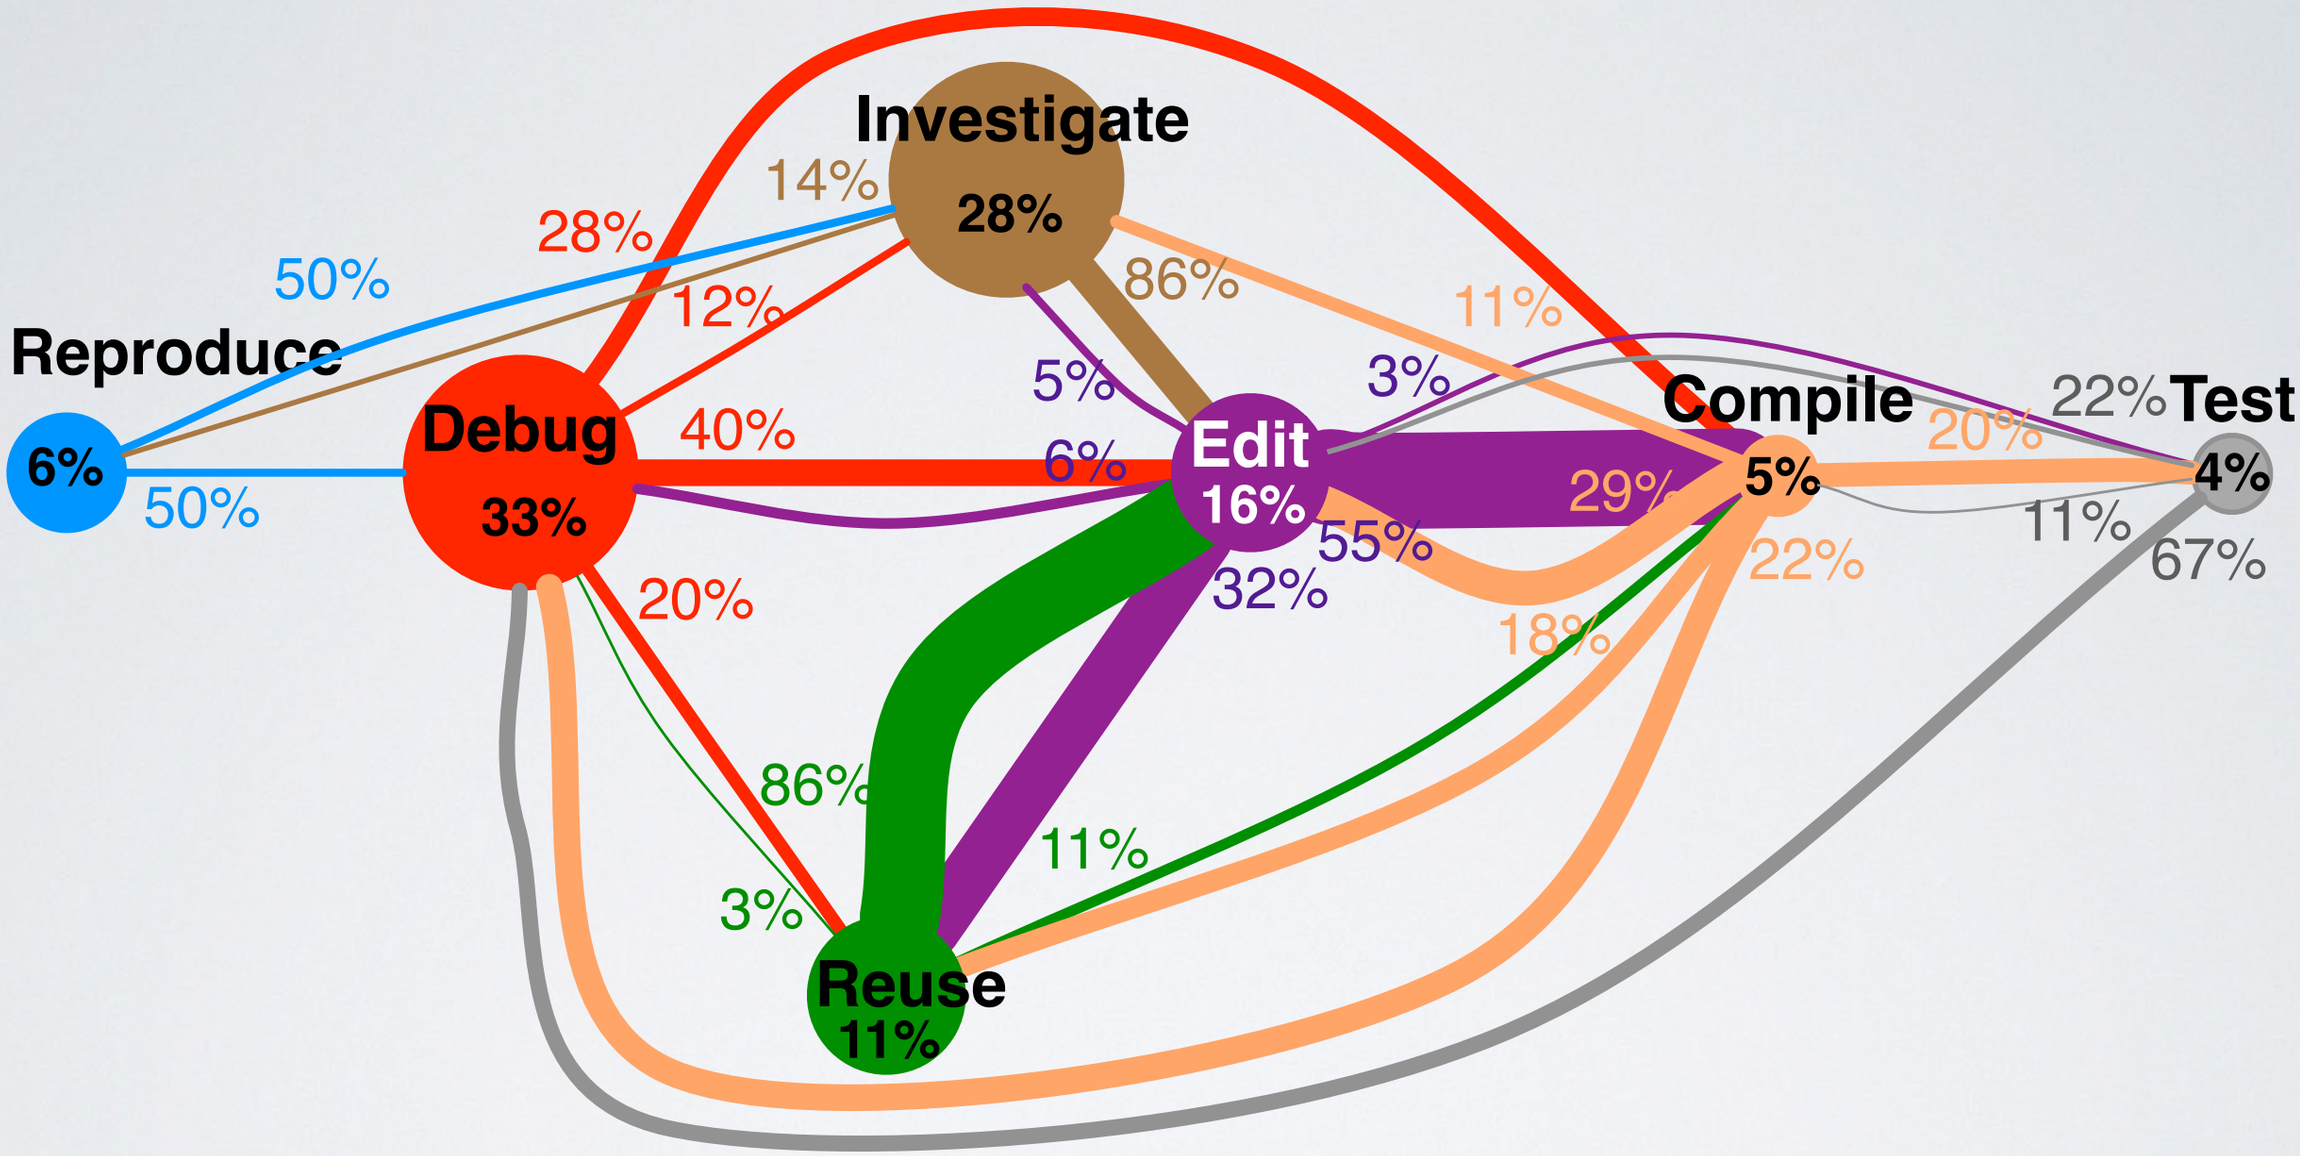
(annotated with observer notes about goals and actions)

(386 pages)

Activities



Coding activities working with unfamiliar code



Circle size: % of time

Edge thickness: % of transitions observed

Longest activities related to control flow questions

4 out of the 5 longest investigation activities

Primary question	**Time** (mins)	**Related control flow question**
How is this data structure being mutated in this code?	83	Search downstream for **writes** to data structure
“Where [is] the code assuming that the tables are already there?”	53	**Compare** behaviors when tables are or are not loaded
How [does] application state change when *m* is called denoting startup completion?	50	Find field **writes** caused by m
“Is [there] another reason why *status* could be non-zero?”	11	Find statements through which values **flow** into status

5 out of the 5 longest debugging activities

Where is method *m* generating an error?	66	Search downstream from *m* for **error** text
What resources are being acquired to cause this deadlock?	51	Search downstream for **acquire** method calls
“When they have this attribute, they must use it somewhere to generate the content, so where is it?”	35	Search downstream for **reads** of attribute
“What [is] the test doing which is different from what my app is doing?”	30	**Compare** test traces to app traces
How are these thread pools interacting?	24 19	Search downstream for **calls** into thread pools

Longest debugging activity

Where is method *m* generating an error?

Rapidly found method *m* implementing command
Unsure **where** it generated error

static call traversal

Statically traversed calls looking for something that would generate error

debugger

Tried debugger

grep

Did string **search** for error, found it, but many callers

debugger

Stepped in debugger to find something relevant

static call traversal

Statically **traversed** calls to explore

debugger

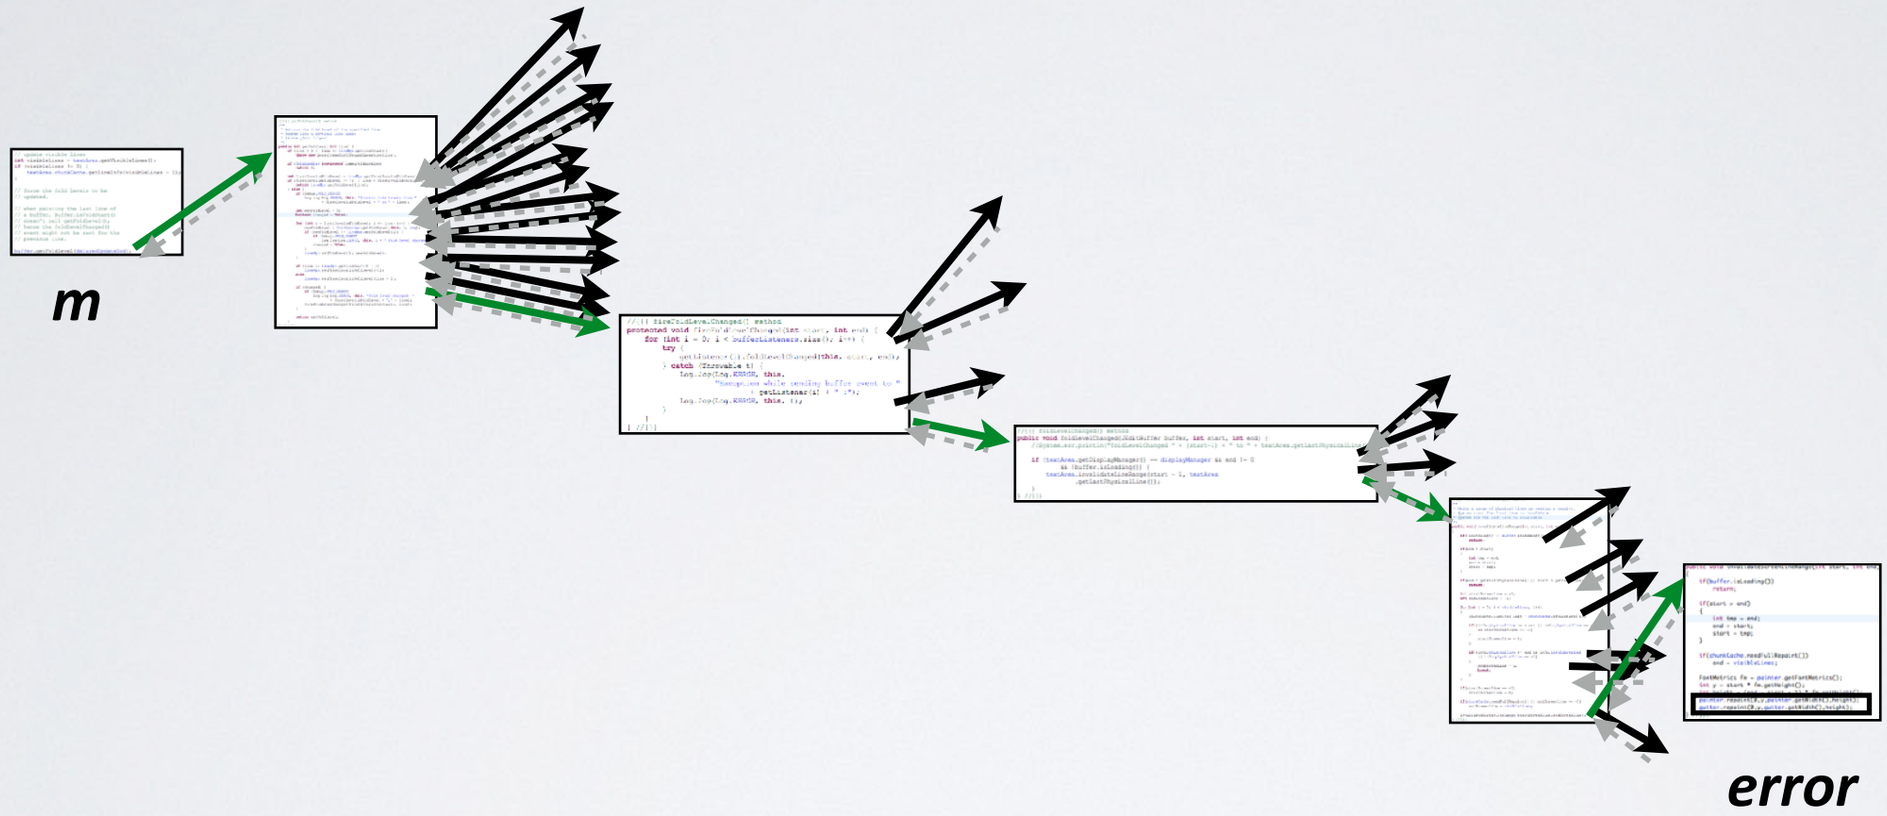
Went back to **stepping** debugger to inspect values
Found the answer

(66 minutes)

Why was this question so hard to answer?

Hard to pick the **control flow path** that leads from starting point to target

Guess and check: which path leads to the target?



Why are control flow questions frequent?

Helps answer questions about

causality	What does this do? What causes this to happen?
ordering	Does A happen before B?
choice	Does x always occur? In which situations does x occur?

When scattered across a codebase, finding statements to answer these questions can be hard.

lab observations

Defect-related false assumptions & incorrectly answered questions related to **control flow**

field observations

Primary questions from longest investigation & debugging activities related to **control flow**

Reachability Questions

(common characteristics of evidence sought)

28

lab observations

Defect-related false assumptions & incorrectly answered questions related to **control flow**

field observations

Primary questions from longest investigation & debugging activities related to **control flow**

Reachability Questions

(common characteristics of evidence sought)

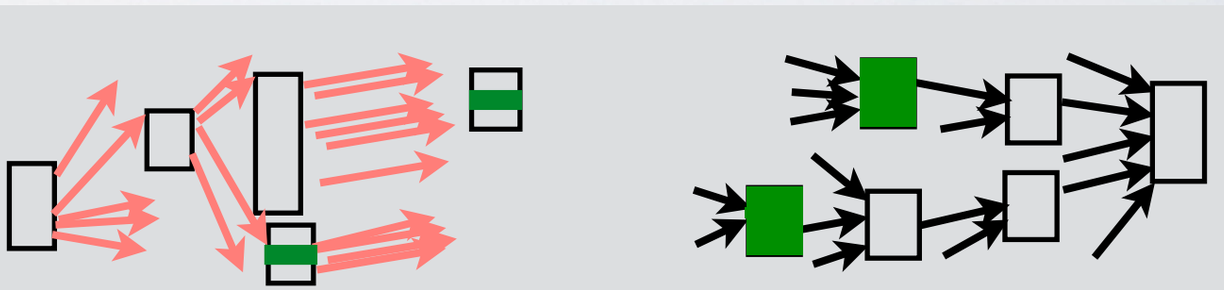
A search along **feasible paths** **downstream** or **upstream** from a statement for **target statements** matching **search criteria**

feasible paths ∩ statements matching search criteria

feasible paths

filter compare

downstream **upstream**



search criteria

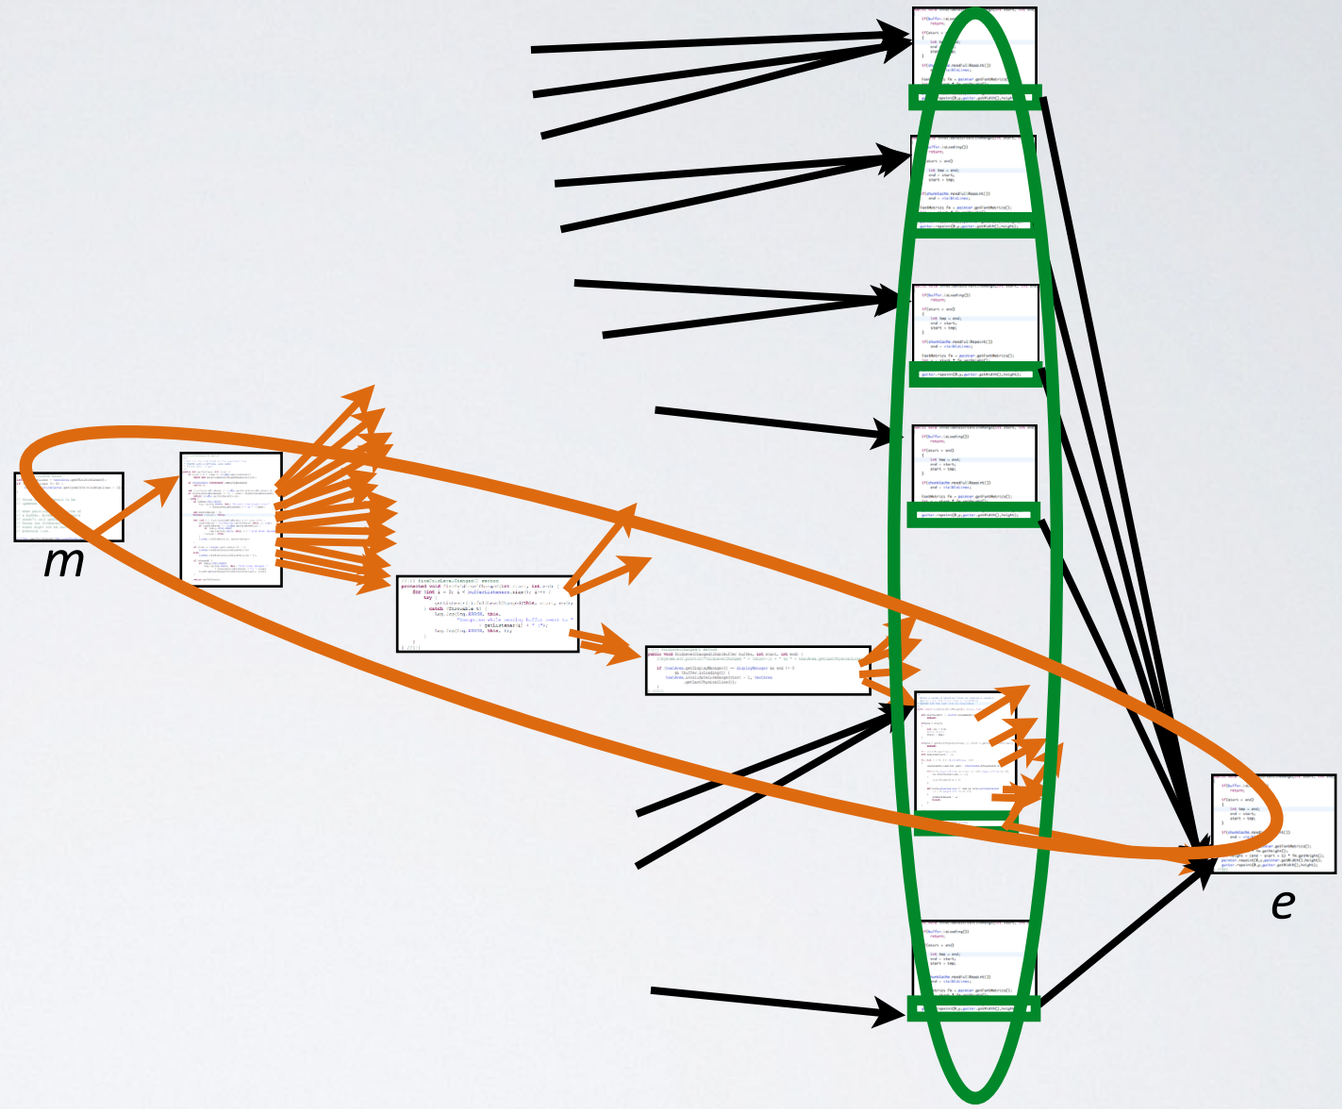
identifier
statement type (field write/read, library call)

29

Reachability question: example

Where is method *m* generating an error?

A search along **feasible paths** **downstream** or **upstream** from a statement (*m)* for **target statements** matching **search criteria (calls to method e)**



feasible paths ∩ **statements matching search criteria**

Longest activities related to reachability questions

4 out of the 5 longest investigation activities

Primary question	**Time** (mins)	**Related reachability question**
How is this data structure being mutated in this code?	83	Search downstream for **writes** to data structure
“Where [is] the code assuming that the tables are already there?”	53	**Compare** behaviors when tables are or are not loaded
How [does] application state change when *m* is called denoting startup completion?	50	Find field **writes** caused by m
“Is [there] another reason why *status* could be non-zero?”	11	Find statements through which values **flow** into status

5 out of the 5 longest debugging activities

Where is method *m* generating an error?	66	Search downstream from *m* for **error** text
What resources are being acquired to cause this deadlock?	51	Search downstream for **acquire** method calls
“When they have this attribute, they must use it somewhere to generate the content, so where is it?”	35	Search downstream for **reads** of attribute
“What [is] the test doing which is different from what my app is doing?”	30	**Compare** test traces to app traces
How are these thread pools interacting?	19	Search downstream for **calls** into thread pools

Insights

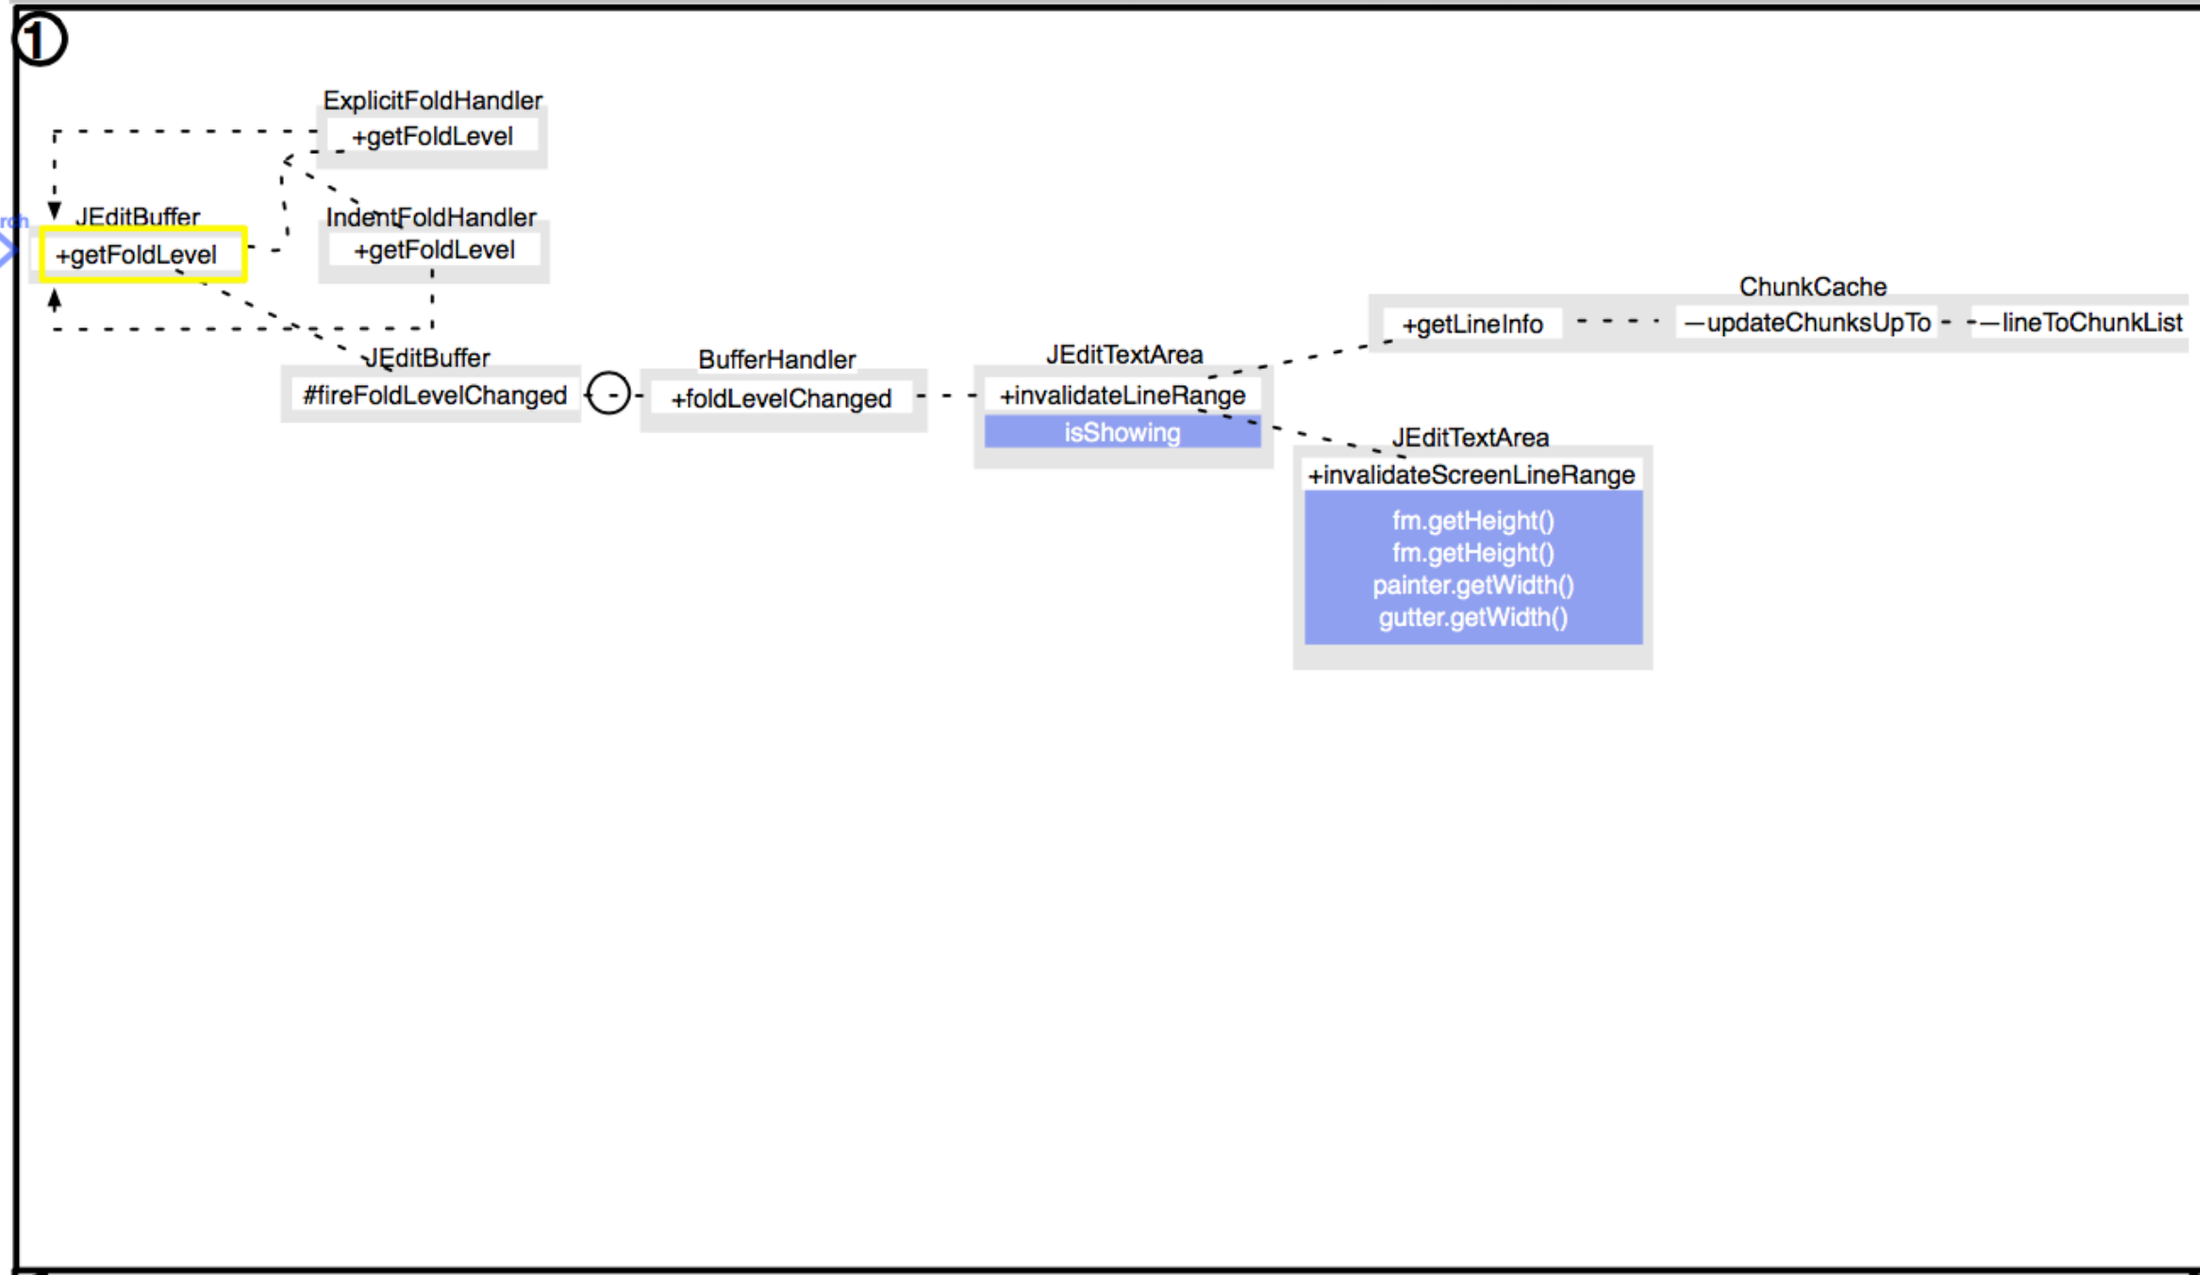
- Developers can construct **incorrect** mental models of control flow, leading them to insert **defects**

- The **longest** investigation & debugging activities involved a single primary question about control flow

- Found evidence for an underlying cause of these difficulties
  Challenges answering **reachability question**s

New Back Forward Exclusions... depth limit 1 2 5 10 20 ∞

ALL EXTERNAL CALLS FIE WRITES



1 downstream from *JEditBuffer.getFoldLevel*

search for external calls

public int getFoldLevel(int line) : 1463 - 1475

```
{
if (line < 0 || line >= lineMgr.getLineCount())
     throw new ArrayIndexOutOfBoundsException(line);

if (foldHandler instanceof DummyFoldHandler)
     return 0;

int firstInvalidFoldLevel = lineMgr.getFirstInvalidFoldLevel();
if (firstInvalidFoldLevel == -1 || line < firstInvalidFoldLevel) {
     return lineMgr.getFoldLevel(line);
} else {
if (Debug.FOLD_DEBUG)
     Log.log(Log.DEBUG, this, "Invalid fold levels from "
          + firstInvalidFoldLevel + " to " + line);
```

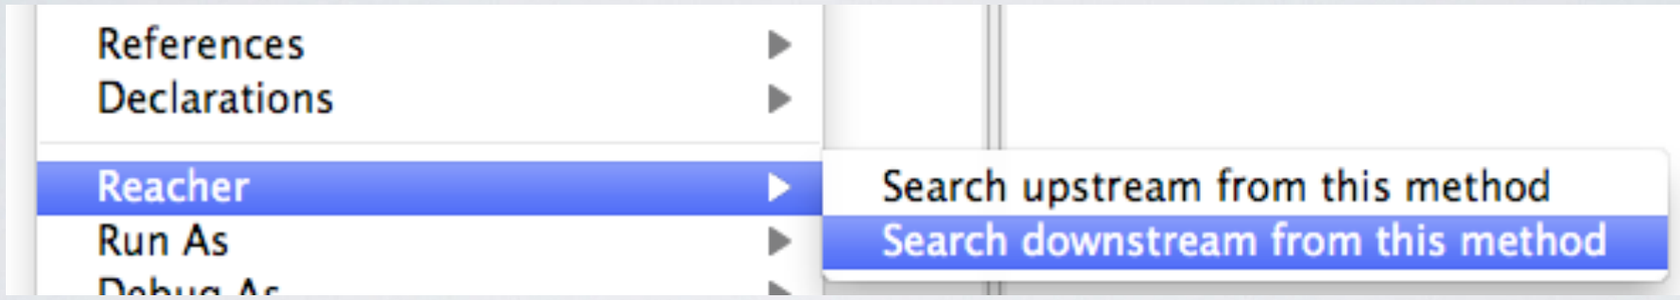
Paper prototype study

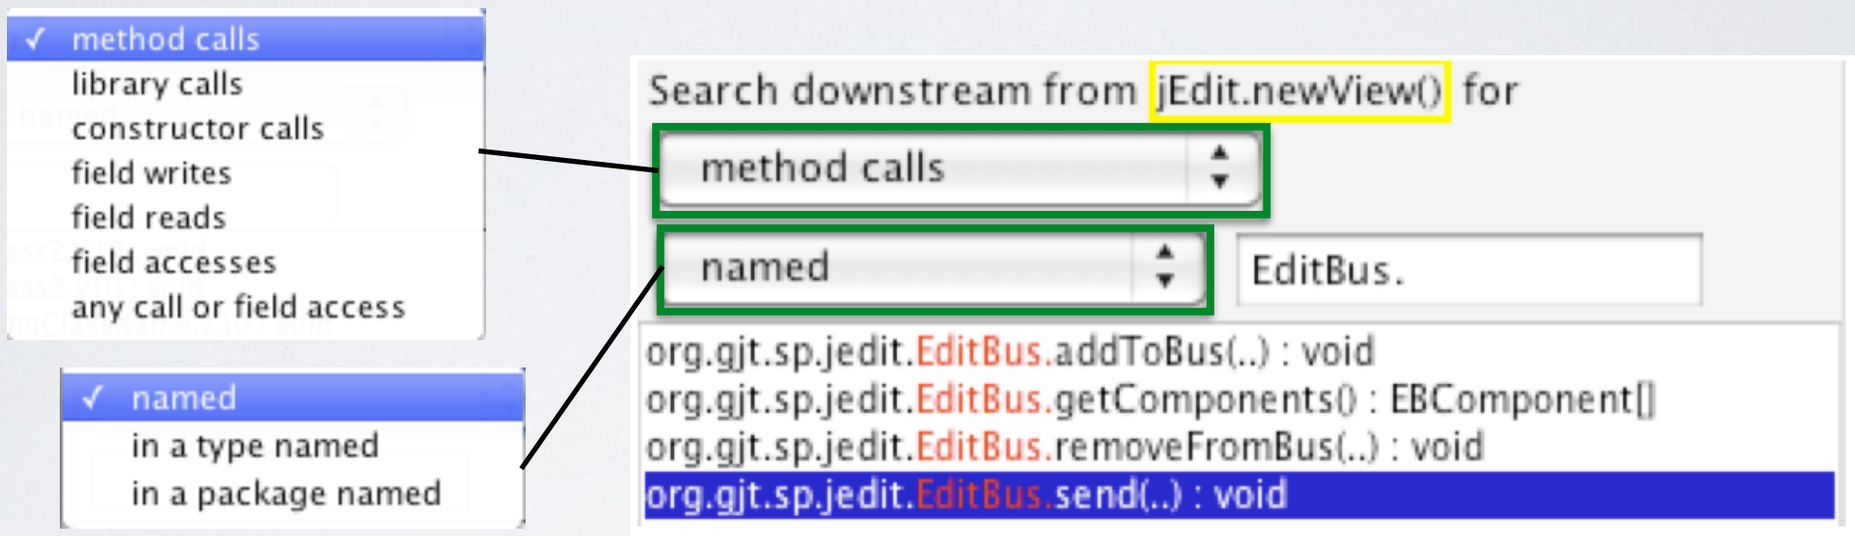
- Built mockups of interface for task from lab study
- Asked 1 participant to complete lab study task with Eclipse & mockup of Reacher
  - Paper overlay of Reacher commands on monitor
  - Experimenter opened appropriate view
- Asked to think aloud, screen capture + audio recording

Study results

- Used Reacher to explore code, unable to complete task
- Barriers discovered
  - Wanted to see methods before or after, not on path to origin or destination
  - Switching between downstream and upstream confusing, particularly search cursor
  - Found horizontal orientation confusing, as unlike debugger call stacks
  - Wanted to know when a path might execute

Step 2: Find statements matching search criteria





Examples of observed reachability questions Reacher supports	**Steps to use Reacher**
What resources are being acquired to cause this deadlock?	Search downstream for each method which might acquire a resource, pinning results to keep them visible
When they have this attribute, they must use it somewhere to generate the content, so where is it?	Search downstream for a field read of the attribute
How are these thread pools interacting?	Search downstream for the thread pool class
How is data structure *struct* being mutated in this code (between *o* and *d*)?	Search downstream for *struct* class, scoping search to matching type names and searching for field writes.
How [does] application state change when *m* is called denoting startup completion?	Search downstream from *m* for all field writes

Step 3: Help developers understand paths and stay oriented

Goal: help developers reason about control flow by summarizing statements along paths in **compact** visualization

Challenges:
control flow paths can be

complex

long

repetitive

developers get lost and disoriented navigating code

Approach:

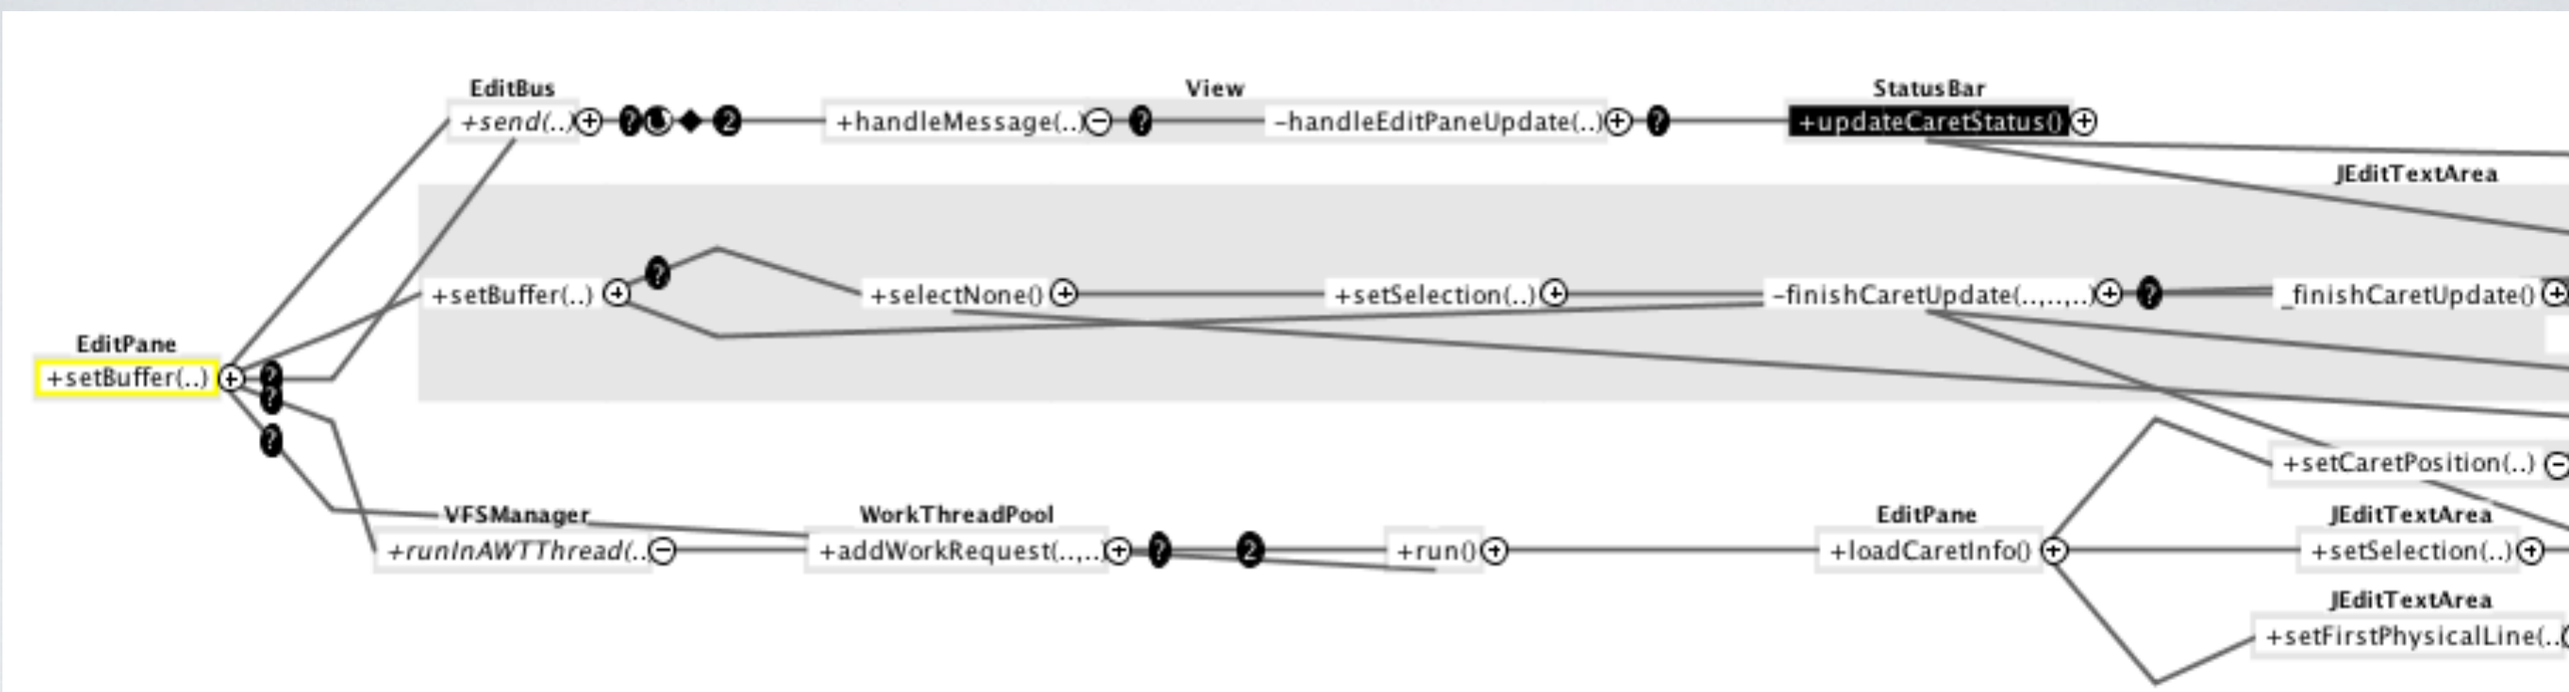
visually encode properties of path

hide paths by default

coalesce similar paths

use visualization to support navigation

Example



EditBus
+send(..)
View
+handleMessage(..)
-handleEditPaneUpdate(..)
StatusBar
+updateCaretStatus()
JEditTextArea
+setBuffer(..)
+selectNone()
+setSelection(..)
-finishCaretUpdate(..,..,..)
_finishCaretUpdate()
EditPane
+setBuffer(..)
+setCaretPosition(..)
VFSManager
+runInAWTThread(..
WorkThreadPool
+addWorkRequest(..,..
+run()
EditPane
+loadCaretInfo()
JEditTextArea
+setSelection(..)
JEditTextArea
+setFirstPhysicalLine(..

Evaluation

Does REACHER enable developers to answer reachability questions faster or more successfully?

Method

12 developers

15 minutes to answer **reachability** question x **6**

Eclipse only on 3 tasks

Eclipse w/ REACHER on 3 tasks

(order counterbalanced)

Tasks

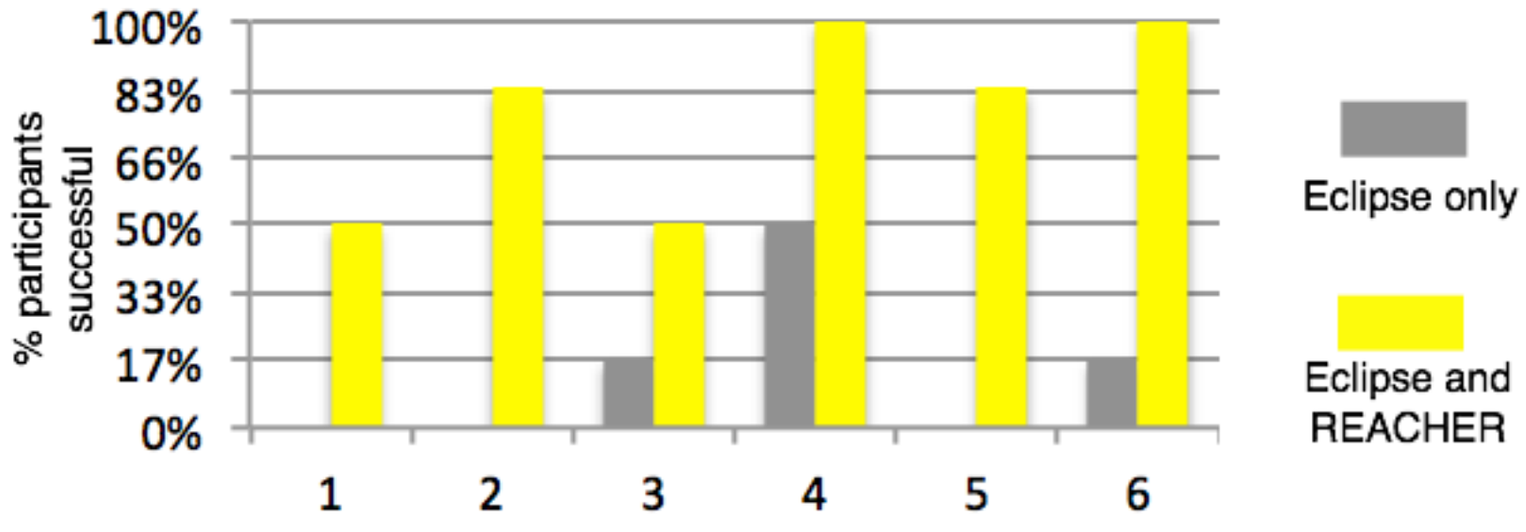
Based on developer questions in lab study.

Example:

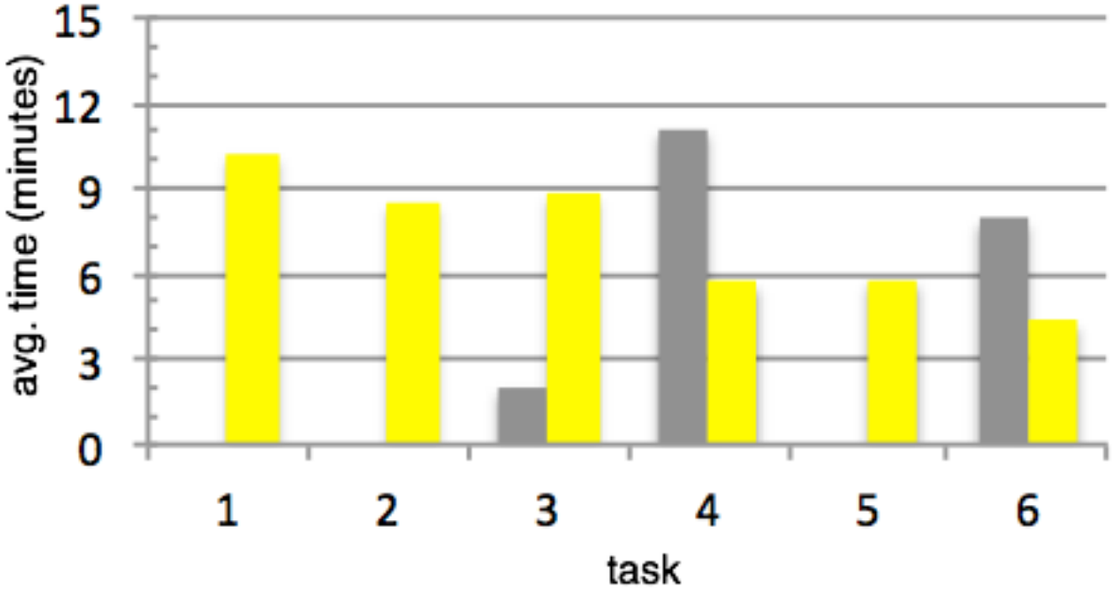
When a new view is created in jEdit.newView(View), what messages, in what order, may be sent on the EditBus (EditBus.send())?

Results

Developers with REACHER were **5.6** times more **successful** than those working with Eclipse only.



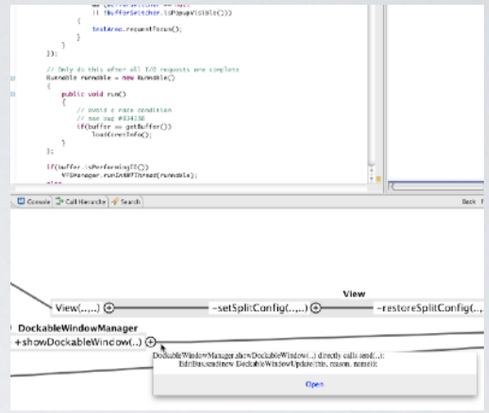
(not enough successful to compare time)



Task time includes only participants that succeeded.

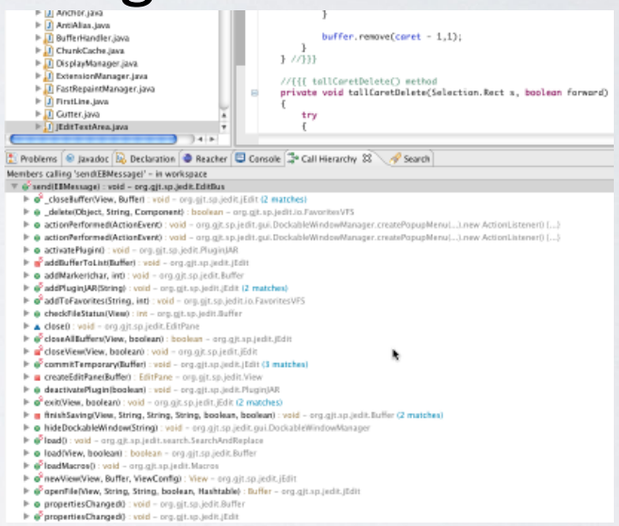
REACHER helped developers stay oriented

Participants with **REACHER** used it to jump between methods.



> *"It seems pretty cool if you can navigate your way around a complex graph."*

When **not** using REACHER, participants often reported being lost and confused.



> *"Where am I? I'm so lost."*
>
> *"These call stacks are horrible."*
>
> *"There was a call to it here somewhere, but I don't remember the path."*
>
> *"I'm just too lost."*

Participants reported that they liked working with REACHER.

> *"I like it a lot. It seems like an easy way to navigate the code. And the view maps to more of how I think of the call hierarchy."*
>
> *"Reacher was my hero. … It's a lot more fun to use and look at."*
>
> *"You don't have to think as much."*

Reflection on design process

- Started with a goal: make debugging in large, complex codebases better
- Observed users to build **insight** into what key challenge was
- Rather than address usability challenges of existing debugging tools, designed new way to debug
- Gathered evidence that it worked better

Needfinding

Needfinding (a.k.a. design research)

- Goal: understand user's needs
- Use of methods to gather qualitative data
    - behaviors, attitudes, aptitudes of potential and existing users
    - technical, business, and environmental contexts - domain
    - vocabulary and social aspects of domain
    - how existing products used
- Empowers team w/ credibility and authority, helping inform decisions

Needfinding vs. market research

Needfinding

- What users really need
- How they will really use product
- Qualitative methods to study in depth
- Small numbers of participants

Market research

- Who might purchase item
- What factors influence purchasing
- Quantitative studies w/ focus groups, surveys
- Large numbers of participants

Example

- Cooper conducted a user study for entry-level video editing product

- Company built professional software, looking to move into consumer software

    - Help connect those w/ computers and video cameras

- Found strongest desire for video editing was parents

- Found 1/12 had successfully connected camera, using work IT guy

Solving the correct problem

- Practices may sometimes mask deeper problems
- Goal: uncover layers of practices to understand how problems emerge

Interviews

- May include bother current users and potential users w/ related needs
- Questions
  - context of how product fits into lives or work
  - when, why, how is or will product be used
  - what do users need to know to do jobs?
  - current tasks and activities, including those not currently supported
  - goals and motivations of using product
  - problems and frustrations with current products or systems

Observations

- Most incapable of accurately assessing own behaviors
- May avoid talking about problems to avoid feeling dumb
- Observing yields more accurate data
- Capture behaviors: notes, pictures, video (if possible)

Contextual inquiry

- Method that includes both interviews and observations
- Next time

Ideation

Ideation

- Process of generating, developing, communicating new **ideas**
- Guidelines and best practices
  - Generate **numerous** ideas
  - Number ideas
  - Avoid premature dismissal of ideas
  - Sharpen the **focus** - pose the right problem
  - Build and jump - build to keep momentum on ideas, jump when theme tapers out
